Exercise 3.5: Access from Outside the Cluster

You can access a Service from outside the cluster using a DNS add-on or environment variables. We will use environment variables to gain access to a Pod.

1. Begin by getting a list of the pods.

```
student@lfs458-node-1a0a:~$ kubectl get po
NAME                     READY     STATUS    RESTARTS   AGE
nginx-1423793266-13p69   1/1       Running   0          4m10s
nginx-1423793266-8w2nk   1/1       Running   0          8m2s
nginx-1423793266-fbt4b   1/1       Running   0          8m2s
```

2. Choose one of the pods and use the exec command to run **printenv** inside the pod. The following example uses the first pod listed above.

```
student@lfs458-node-1a0a:~$ kubectl exec nginx-1423793266-13p69 \
    -- printenv |grep KUBERNETES
KUBERNETES_SERVICE_PORT=443
KUBERNETES_SERVICE_HOST=10.96.0.1
KUBERNETES_SERVICE_PORT_HTTPS=443
KUBERNETES_PORT=tcp://10.96.0.1:443
<output_omitted>
```

3. Find and then delete the existing service for **nginx**.

```
student@lfs458-node-1a0a:~$ kubectl get svc
NAME         TYPE         CLUSTER-IP      EXTERNAL-IP   PORT(S)   AGE
kubernetes   ClusterIP    10.96.0.1       <none>        443/TCP   4h
nginx        ClusterIP    10.100.61.122   <none>        80/TCP    17m
```

4. Delete the service.

```
student@lfs458-node-1a0a:~$ kubectl delete svc nginx
service "nginx" deleted
```

5. Create the service again, but this time pass the `LoadBalancer` type. Check to see the status and note the external ports mentioned. The output will show the `External-IP` as `pending`. Unless a provider responds with a load balancer it will continue to show as pending.

```
student@lfs458-node-1a0a:~$ kubectl expose deployment nginx --type=LoadBalancer
service/nginx exposed

student@lfs458-node-1a0a:~$ kubectl get svc
NAME         TYPE           CLUSTER-IP       EXTERNAL-IP   PORT(S)        AGE
kubernetes   ClusterIP      10.96.0.1        <none>        443/TCP        4h
nginx        LoadBalancer   10.104.249.102   <pending>     80:32753/TCP   6s
```

6. Open a browser on your local system, not the lab exercise node, and use the public IP of your node and port 32753, shown in the output above. If running the labs on remote nodes like **AWS** or **GCE** use the public IP you used with PuTTY or SSH to gain access.

Figure 3.1: **External Access via Browser**

7. Scale the deployment to zero replicas. Then test the web page again. Once all pods have finished terminating accessing the web page should fail.

```
student@lfs458-node-1a0a:~$ kubectl scale deployment nginx --replicas=0
deployment.apps/nginx scaled

student@lfs458-node-1a0a:~$ kubectl get po
No resources found in default namespace.
```

8. Scale the deployment up to two replicas. The web page should work again.

```
student@lfs458-node-1a0a:~$ kubectl scale deployment nginx --replicas=2
deployment.apps/nginx scaled

student@lfs458-node-1a0a:~$ kubectl get po
NAME                     READY     STATUS    RESTARTS   AGE
nginx-1423793266-7x181   1/1       Running   0          6s
nginx-1423793266-s6vcz   1/1       Running   0          6s
```

9. Delete the deployment to recover system resources. Note that deleting a `deployment` does not delete the endpoints or services.

```
student@lfs458-node-1a0a:~$ kubectl delete deployments nginx
deployment.apps "nginx" deleted

student@lfs458-node-1a0a:~$ kubectl delete ep nginx
endpoints "nginx" deleted

student@lfs458-node-1a0a:~$ kubectl delete svc nginx
service "nginx" deleted
```
